```
Some common UNIX commands
-------------------------

pwd                             Diplay the name of the current directory
cd <directoryName>              Change directory.  Example:  cd cgs4406
cd ..                           Back up one directory
ls                              List contents of current directory
ls -l                           Long listing with more information on files
mkdir <name>                    Make directory.   Example:  mkdir pip1
rmdir <name>                    Remove directory. Example:  rmdir pip1
cp <filename> <filename>        Copy command.  Filename can include a
                                directory path as well.
                                Example:  cp pip1/utility.h pip2
mv <filename> <filename>        Move.  (Also functions as rename).
                                Examples:  mv pip1 pip2
                                           mv file1.txt file2.txt
rm <filename>                   Remove.  Example:  rm digitime.cpp
man <command>                   Show manual page on a particular command
                                Example:  man mkdir
chmod <option> <name>           Change Mode.  Changes the file permissions
                                for directories and files.
                                Example:  chmod 755 public_html
pico                            Opens up the pico text editor to a blank
                                file
pico <filename>                 Opens a file in the pico text editor
```
